TITLE: Basic characteristics of high-speed motion picture cameras

SOURCE: Akademiya nauk SSSR. Komissiya po nauchnoy fotografii i kinomatografii.
Uspekhi nauchnoy fotografii, v. 9, 1964, 5-11

TOPIC TAGS: high speed camera, motion picture camera

ABSTRACT: The authors define those characteristics of high-speed cameras which determine the limits of their application (principle of arrangement, the information-carrying capacity, and the operational characteristics). The section dealing with the general arrangement of a camera discusses such design features as film shift compensation in cameras with continuously moving film, relative "standstill" of the image and film, etc. The information-carrying capacity is considered in time and space, and the capacity is derived. Lens power (relative aperture), synchronization of the exposure with the beginning of the process studied, and the positioning of objectives in multiple-lens cameras are considered the main operation characteristics. The data according to the above classification are tabulated for twelve Soviet-made cameras (see table).

TITLE: Scanning camera capable of 500 million frames per second

SOURCE: Akademiya nauk SSSR. Komissiya po nauchnoy fotografii i kinematografii.

Uspekhi nauchnoy fotografii, v. 9, 1964, 27-28

TOPIC TAGS: high speed camera, motion picture camera, plasma research/RKS-1

motion picture camera, RKS-2 motion picture camera, 16S-2 motion picture camera

ABSTRACT: A group of designers associated with the Leningrad Institute of Motion

Picture Engineers has perfected their RKS-1 camera. Originally developed in 1958

with a capacity of 100 million frames per second, the camera's exposure frequency has now been increased to 500 million frames per second for use in the investigation of certain plasma, light amplification, chemical, and nuclear processes. The general arrangement of the new camera, the RKS-2, is shown in a diagram. The camera is provided with three exchange lenses with focal lengths of 35, 50 and 85 mm. The camera is suitable for both macro- as well as microphotographs. The scanning is effected by either of two point rasters (0.4 and 0.7 mm spacing, giving a capacity of 90 and 250 frames, respectively). The two mirrors rotate at 30,000 rpm. Twenty-four exposure frequencies can be selected with 10 sup 7 frames per second. The mirror rotating system develops and transmits a synchronizing signal to the object at a pre-set speed. The decoding of the images can be accomplished in the camera.

The 16S-2 motion picture camera can be used for transfer of the images to 16 mm film. Orig. art. has 1 figure.

ABSTRACT: As reported earlier by Provornov and Grebennikov (Tekhn. kino i televideniya, 1957, No 2; 1959, No 2), the Leningrad institute LIKI has been working for years on the development of the raster-type motion picture camera. In 1957 several laboratory models of cameras with a speed of 100 million frames per second were produced; in 1960 a triggered camera with a speed range of 1,000 to 150,000 frames per second, and in 1963 a raster type motion picture camera with a speed of up to 500 million frames per second

ACC NR: AP7010699

were produced. Although two later models have gone into production at the Krasnogorsk Mechanical Works, this article gives the general principles of operation and the technical characteristics for the 1963 camera, the RKS-2M. The optical raster was produced at NIKFI (Scientific-Research Motion Picture Institute) and consists of a glass plate on which a number of spherical lenses are arranged so that each will produce in a single plane a circular image of the photographed object about 5-10 microns in diameter. The RKS-2M is described as a completely reliable camera. The illustrations include diagrams of the main optical system, the drive system and block diagram of the control panel, and photographs of the complete set, including auxiliaries, of the camera itself (1,500 mm long, 400 mm wide, 600 mm high, 100 kilograms) and six frames showing the various phases of discharge of the ISSh-500 pulsed tube obtained with the RKS-2M at a speed of 260 million frames per second, using 16-mm "Mikro" film. TOPIC TAGS: sheet metal, vibration analysis, metal test, material deformation, vibration wrapping

ABSTRACT: Conditions for modernizing wrapping presses were analyzed for the purpose of using vibrational forming of blanks at the final stage of wrapping. A laboratory setup was developed for wrap-forming vibration. According to the results obtained from tests on the experimental setup, it was determined that the combination of static and vibrational methods of application of force in forming a specimen reduces the number of transitory stages by 25—30%. The deformation resistance of metal is reduced and the area of uniform deformations is slightly increased. The

TITLE : Raising the Field Germination of Shark Wheat Seeds

DOC. NO. : Dokl. Akad. Nauk SSSR, 1957, No. 5, 21-25

SYNOPSIS : Study of the influence of various factors on field germination of winter wheat seeds of Shark was carried out by the chair of plant growth of the Azerbaijan Agricultural Institute during the years of 1952 through 1956. Careful purification and sorting of the sowing material according to its absolute and specific gravity affects the germination of wheat seeds. The best absolute weight for Shark winter wheat is 52-56 grams. The highest crop is obtained under optimum sowing periods at a depth of 2-7 cm, under the introduction of manure up to sowing.

 Kuznetsov and G.M. Pchelintseva; Tech. Ed.: E.I. Maslov.

Summary: This volume is intended for scientists, engineers, physicists, and
 biologists working in the production and peaceful applications of atomic
 energy; for professors and students of higher technical schools of
 higher technical education where the subject is taught; and for people
 interested in atomic sciences and technology.

Contents: This is volume 3 of a 4-volume set of reports on atomic energy,
 presented by Soviet scientists at the Second International Conference on the
 Peaceful Uses of Atomic Energy, held in Geneva from September 1 to 13, 1958.
 Volume 3 consists of two parts. The first part, edited by A.I. Zubov, is
 devoted to geology, prospecting, concentration and processing of nuclear
 energy material. The second part, edited by G.L. Zverev, includes 27 reports
 on metallurgy, metallography, processing technology of nuclear fuel and
 reactor metals, and neutron irradiation effects on metals. The titles of the
 individual papers in most cases correspond with the titles of the articles in
 the original Russian language edition on the Chemical Problems of Processing
 NOV/2001 for the titles of the other volumes of the set.

Summary: A.A. Bockman, V.I. Kuznetsov, I.I. Korotkiy, I.A. Fedotkin, D.D.

TITLE: Effect of the crystallization speed and annealing on the plastic properties of high-boron steel

SOURCE: Atomnaya energiya, v. 18, no. 6, 1965, 644-646

TOPIC TAGS: stainless steel, boron containing stainless steel, cast steel microstructure, cast steel plasticity, crystallization speed effect, rolled steel plasticity

ABSTRACT: Stainless steel containing 0.03—0.05% C, 0.40—0.61% Si, 19.9—20.7% Cr, 14.5—17.9% Ni and 1.86—2.35% B was cast at 1450—1500C in sand or in copper molds, the latter with a wall thickness of 20 mm. The ingots, 15 mm thick, were rolled at 1150—950C to a thickness of 1—6 mm with a 0.2—1.0 mm reduction per pass, annealed at 1100C for 10 min and air cooled. Microscopic examination showed that the crystallization rate significantly affected the grain size and shape of the boride phase and the mechanical properties

Card 1/2

L-57878-65

ACCESSION NR: AP5016937

of cast metal. The average thickness of borides crystallized in sand molds was 10 μ , while borides crystallized in copper molds were 0.5—3.0 μ thick. This fragmentation of the boride component sharply increased the steel ductility. Sheets, 1 mm thick, without edge cracks and tears were successfully rolled only from ingots cast in copper molds. The difference in the size of boride particles in the outer and central portion of the ingot had no adverse effect on the ductility of ingots. The size of boride grains in rolled metal depended on their size in the initial ingots. Thus, sheets rolled from ingots cast in copper molds had finer boride grains. Subsequent high-temperature annealing improved the microstructure and plastic properties of ingots. Annealing also improved the mechanical properties of rolled metal. TITLE: Effect of vanadium on the phase composition and structure of high-boron steel

SOURCE: Atomnaya energiya, v. 20, no. 2, 1966, 144-145

TOPIC TAGS: boron steel, high boron steel, steel machinability, machinability improvement, boron containing steel, alloy steel, vanadium containing steel

ABSTRACT: The effect of vanadium on the structure and machinability of high-boron steels has been studied. These steels have a low plasticity and machinability caused by a high content of boron phase of the M_2B type. The amount of this phase can be reduced by promoting formation of borides containing more boron per unit volume than M_2B . Nine heats containing up to 0.02% carbon, 0.47—20.4% chromium, 0—17.83% nickel, 2.88—3.46% boron and 0—11.2% V were tested. It was found that in the presence of vanadium, in addition to M_2B boride, a tetragonal M_3B_2 boride is formed whose quantity increases with increasing vanadium content. At 11% vanadium, the whole boride phase consists of M_3B_2 , and the volume of the boride phase decreases by approximately 10%. The steel containing 3—3.5% boron and 7—11% vanadium can be easily machined with standard cutting tools. Orig. art. has: 2 figures and 1 table.

TITLE: To Introduce New Methods in Laboratory Practice (Novoye - v laboratornyy praktikum)

PERIODICAL: Vestnik vysshey shkoly, 1957, Nr 5, pp 71 - 73 (USSR)

ABSTRACT: New laboratory work methods of measuring electrically non-electric values were elaborated at the chair of Principles of Electric Engineering of the Moscow Institute of Mechanization and Electrification in Agriculture. The aim of this work is to acquaint the students with the utilization of the wire transducers for the investigation of bending and torsion.

The investigation of bending is described first. A wire transducer having a resistance of 100 ohm is glued to a console beam as shown in Figure 1. The investigation is made by means of an electric bridge circuit mounted on a wooden panel and consisting of 100-ohm resistors. A variable 2-ohm wire resistor is located in series with a fixed resistor on one of the bridge arms. A mirror galvanometer is used for obtaining the zero reading. Current is supplied by a battery. The sensitivity of the bridge circuit may be altered by changing the battery voltage. By changing the resistance, the sensitivity of the galvanometer can be altered.

ABSTRACT: The authors investigated the passage of white noise through a linear system of the first order with a variable parameter. It is assumed that changes in the parameter occurs according to the harmonic law. The correlation function and the variance of the process at the output of the system are found. It is shown that the approach to the solution of the given problem can be used in a number of other cases. The authors' summary. [Translation of abstract] [NT]

pp 161-172

ABSTRACT: The problems of supplying electricity, heat, and gas to Frunze City can be solved in connection with construction of a heat-and-electricity station in the near future. This necessitates operating the station on the basis of a complex processing of solid fuel which would permit raising fuel utilization up to 70-80%. Indexes of city growth are presented, as well as methods for determining heat consumption by residential, administrative, and community buildings, by municipal utilities, suburban agriculture, railroad transportation, and industries. A table on long-range heat consumption is compiled.

Card 1/2

SOV/112-59-2-2588

Long-Term Heat Consumption by Frunze City

Information about carrying the heat loads today is provided. Industry is the largest long-range and present consumer (about 60% of the heat load); it is followed by the residential load (about 20%). A considerable increase in fuel deliveries to Frunze City to satisfy heat requirements is necessary during the next few years as well as in the future, and also in production of electric energy and residential-service gas. Bibliography: 14 items.

TITLE: On the stability of some classes of orbits of artificial Earth satellites

SOURCE: AN SSSR. Iskusst. spunikl Zemli, no. 16, 1963, 163-172

TOPIC TAGS: satellite, Earth satellite, artificial satellite, artificial Earth satellite, stability, orbit stability, equatorial orbit, circular equatorial orbit, polar orbit, elliptical orbit, polar elliptical orbit, ellipsoidal orbit, hyperboloidal orbit, hyperbolic orbit

ABSTRACT: This theoretical paper issues from the authors' antecedent study, in the same series of booklets, no. 8, 1961, 64, in which the motion of artificial Earth (E) satellites (S) was examined in the normal gravitational field (NGF) of the E. The NGF, in the geocentric system of cylindrical coordinates, r , ϕ , z , the principal plane of which is assumed to be the equatorial plane of the E, and the z axis is the axis of rotation of the E, is expressed by the formula

$$U = \frac{IM}{2} \left\{ \frac{1}{\sqrt{r^2 + (z-ci)^2}} + \frac{1}{\sqrt{r^2 + (z+ci)^2}} \right\} \quad (1)$$

Card 1/3

ACCESSION NR: AT3006845

where f is the gravitational constant, M is the mass of the E , and $c=210$ km is a quantity determined by the flattening of the E . The present paper investigates the stability (in the sense of A. M. Lyapunov) of the particular solutions admitted by the differential equations of motion of this dynamic problem, also their stability under constantly acting perturbations (CAP) of a given form. These solutions, in particular, correspond to polar elliptical orbits, circular equatorial orbits, and periplegmatic orbits located on several ellipsoids, etc. The stability analyses set forth here comprise: (1) Stability of circular equatorial orbits (CEO); it is proved that CEO's are stable under CAP. In the potential of the NGF of the E , there are no longitudinal terms characteristic of triaxiality and also no terms that might be occasioned by asymmetries of the E relative to the equatorial plane. Harmonics of higher orders are also not fully considered. (2) Stability of ellipsoidal and polar elliptical orbits (PEO). It is demonstrated that the PEO's are stable with respect to the major semiaxis and the eccentricity of the ellipse. It is also found that for sufficiently small values of c_{10} , ellipsoidal orbits will also be stable in the Lyapunov sense relative to the major axis and the eccentricity of the ellipsoids along which the artificial S moves. (3) Stability of hyperboloidal and hyperbolic orbits (HHO). It is demonstrated that these orbits are stable with respect to the semiaxes of the hyperboloid along which the motion occurs and with respect to its eccentricity. Orig. art. has 61 numbered equations.

TITLE: New copperless electroluminors based on zinc sulfide B

SOURCE: Ref. zh. Fizika, Abs. 11D469

REF SOURCE: Sb. Proboy dielektrikov i poluprovodnikov, M.-L., Energiya, 1964, 356-359

TOPIC TAGS: electroluminescence, luminor, zinc compound optic material, transition element, light excitation, complex molecule.

ABSTRACT: The authors note that neither the existing theories of electroluminescence (EL) nor the treatment of EL within the framework of the band scheme is satisfactory. The aging of luminors in an electric field is considered, especially at increased temperature. It is assumed that besides the non-inertial excitation process there exist also slow processes, connected for example with motions of the ions. A new mechanism of excitation is proposed, connected with the destruction of the complexes produced by activator ions of variable valence with cation vacancies, with ions of the co-activator flux residues, etc. The complexes can be broken up either by the field, by heat, or by both. It is stated that the previously established laws of EL do not contradict the proposed model. To confirm the presented considerations, a ZnS-Cr luminor was synthesized without Cu. It was assumed that the interaction of the transition metal (co-activator) should contribute to the formation of complexes,

Card 1/2

L 33197-66

ACC NR: AR6016213

without contributing to the development of excitation mechanisms within the framework of the existing theories. The obtained luminor had blue EL at a Cr concentration $5 \times 10^{-4} - 10^{-5}$ g/g. A similar luminor without Cr has no EL. The experiment is regarded as proof of the possibility of existence of an ion-hole excitation mechanism of electroluminors by a field, and of the special role played by the transition metals as activators and co-activators in EL of ZnS. Abstract: A study was conducted on different methods of administering
granulated superphosphate for trifoliata, which is a good stock
for citrus plants. The experiment was conducted on an $N_{60}K_{40}$
background. The best results were obtained when doses of 60 kg/
hectare of P_2O_5 were used and when it was applied on 2 sides
3-4 cm lower than the seeds.

AUTHORS: Li, A. F., Grebennikova, O. T.

TITLE: Mineralogical investigation of technological samples of rare metal ores

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 3, 1962, 7, abstract 3051
(V sb. "Issled. po obogashcheniyu o tekhnol. polezn. iskopayemykh",
Moscow, Gosgeoltekhizdat", 1961, 164-172)

TEXT: The authors analyze mineralogical studies of several Li, Be, Nb, Ta and Zr ore types, subjected to concentration in order to obtain conditional concentrates. The investigation methods are schematically explained. The basic tasks for the mineralogical investigation of the substantial composition of rare metal ores consist in studying the chemical composition; the quantitative mineralogical composition of the ore; textural and structural specific features of the ores; grain size of precious minerals and their accessory minerals; the form of appearance of precious basic and accessory elements and harmful inclusions; the nature and degree of changes in both individual minerals and the ore as a whole under the effect of hypogene and hypergene processes. A scheme for the

Mineralogical investigation ...

mineralogical investigation of ores is given: The scheme shows that for the investigation of ores the following data should be available: 1) stepped samples; 2) an average sample of crushed ore and 3) concentration products. Schemes are presented for the mineralogical investigation of technological samples of some rare metal ores (spodumene-containing, beryl-containing, columbite-melisso and loparite-eudialyte ores). The schemes may be modified depending on the substantial ore composition.

TOPIC TAGS: refractory material, refractory material tensile strength, tensile strength test, high temperature tensile strength, high temperature tensile strength tester

ABSTRACT: New and improved equipment was constructed and introduced to industrial practice, and a procedure was developed for high temperature tests (up to 1700C) of refractory materials for tensile strength. Experimental data were obtained on the tensile strength of fireclay, magnesite, magnesiochromite, Dinas brick and non-fired refractories. The curves from repeat experiments were noted to show good coincidence. Bibl. with 11 references. Authors' summary.
